InfoBulle Package Documentation

Yves ZUMBACH

February 2015

1   Preamble

This package is destined to whoever needs it. It is freely available and if you want to, you can modify it and share it(share not sell!).

2   Defined commands

This package mainly define three commands:

- `\normalInfo{<Title>}{<Text>}`

- `\warningInfo{<Title>}{<Text>}`

- `\criticalInfo{<Title>}{<Text>}`

Which results in this:

Title

My content

Title

My content

Title

My content

3   Customization

It is possible to define new infoBulle (here levelInfo) using the following syntax (before `\begin{document}`):

```
\makeatletter

\mdfdefinestyle{level}{some properties}
\newcommand{\levelInfo}[2]{\@infoBulleSkeleton{level}{image.png}{#1}{#2}}

\makeaatother
```

The mdfdefinestyle is a command from the mdframed package that allow you to define which ever property from that package. Personally I solely use this to define the line color (linecolor=red)

The infoBulleSkeleton command take four inputs:

- A mdframed style (level in our example)
- An image contained in the folder defined with the `\path` command
- A title
- Some content
